As far as I know from the original CSV file people.cv, I found that everyone has two phone numbers, so I created a table to save it and build the relationship between the table People and it.

Actually, due to the limited information, I could not find some proper constraints for building the database. So it depends on the situation to use the database. For example when some people have several addresses, then an address table needs to be built like the Phone table. Overall, a good database is always for specific situation, when there is not requirement, I suppose it is better to keep the data like what it is.
